OSI Model — Protocols & Security Technologies by Layer

Concentric view of the seven-layer reference model (ISO/IEC 7498-1): Layer 1 Physical forms the outer ring, Layer 7 Application sits at the core.

Mapping is indicative: several protocols span layers or sit differently in the TCP/IP model (e.g. TLS spans L4–L7; BGP runs over TCP but is charted at L3 for its routing role).
Controls are listed at the layer they primarily act on. No single layer is sufficient — combine controls across layers for defence in depth.
